**Subject:** FW: snapshot jumpstart

I have “unleashed” CGI on getting started on this.

I’ve established framework, and they have begun to build it. They will either restore /sites/production/files from backup on buckeye, or redo the rsync from /sites/production/files to /publicshare location (which will be on buckeye).

we will likely have snapshot.epa.gov as a throwaway sitename until OGC gives us the real name.

Unknown: how to handle www3 content if we’re asked. I say move it into a subdirectory – snapshot.epa.gov/www3/whatever.

You know what no one has ever mentioned, ever? espanol.epa.gov. I know it’s got climate change stuff on it. I guess we need to ask OWC/OGC.

We should be able to look at this area tomorrow or Thursday at the latest.

Mike – I believe strongly that we need a disclaimer like obamawhitehouse.archives.gov has – on every html page. Can you figure out how to insert that with a global edit? I’m guessing there’s somewhere straightforward to insert a div, yes? I would use their language almost verbatim. “This is historical material “frozen in time”. The website is no longer updated and links to external websites and some internal pages may not work.”

Appreciate the comments in the JIRA ticket WCSD-878 that outline the necessary global edits and the potential rewrite rule for sending extensionless URLs to \_.html files.

**Subject:** snapshot jumpstart

use /public/server/htdocs/snapshot2017 as docroot

symlink that to /public/data/snapshot2017 (new directory)

we need everything off the root directory.

/public/data/snapshot2017 - will need some permissions management

mv contents from /public/data1/webmast1/web/JKS/snapshot/\* to /public/data/snapshot2017

execute a file copy on drupal3 from /var/www/html/sites/\* to /publicshare/data/snapshot2017

<VirtualHost \*:80>

ServerName snapshot2017.epa.gov:80

ServerAlias snapshot2017.epa.gov

DocumentRoot "/public/server/htdocs/snapshot2017"

<Directory "/public/server/htdocs/snapshot2017">

Options FollowSymLinks
